**Exam** : **070-561(VB)**

**Title** : TS: MS .NET Framework  
3.5, ADO.NET Application  
Development

**Version** : Demo

1. You create an application by using the Microsoft .NET Framework 3.5 and Microsoft ADO.NET.

You need to ensure that the application can connect to any type of database.

What should you do?

A. Set the database driver name in the connection string of the application, and then create the connection object in the following manner.

```
Dim connection As DbConnection = _  
    New OdbcConnection(connectionString)
```

B. Set the database provider name in the connection string of the application, and then create the connection object in the following manner.

```
Dim connection As DbConnection = _  
    New OleDbConnection(connectionString)
```

C. Create the connection object in the following manner.

```
Dim factory As DbProviderFactory = _  
    DbProviderFactories.GetFactory("System.Data.Odbc")
```

```
Dim connection As DbConnection = _  
    factory.CreateConnection()
```

D. Create the connection object in the following manner.

```
Dim factory As DbProviderFactory = _  
    DbProviderFactories.GetFactory(databaseProviderName)  
Dim connection As DbConnection = factory.CreateConnection()
```

**Answer: D**

2. You create an application by using the Microsoft .NET Framework 3.5 and Microsoft ADO.NET. The application connects to a Microsoft SQL Server 2005 database.

The application throws an exception when the SQL Connection object is used.

You need to handle the exception.

Which code segment should you use?

A. Try

```
    If conn IsNot Nothing Then  
        conn.Close()
```

' code for the query

End If

Catch ex As Exception

' handle exception

Finally

If conn Is Nothing Then

conn.Open()

End If

End Try

B. Try

' code for the query

conn.Close()

Catch ex As Exception

' handle exception

Finally

If conn IsNot Nothing Then

conn.Open()

End If

End Try

C. Try

' code for the query

conn.Open()

Catch ex As Exception

' handle exception

Finally

If conn IsNot Nothing Then

conn.Close()

End If

End Try

D. Try

```
' code for the query
conn.Open()
Catch ex As Exception
' handle exception
Finally
If conn Is Nothing Then
    conn.Close()
End If
End Try
```

**Answer: C**

3. You create an application by using the Microsoft .NET Framework 3.5 and Microsoft ADO.NET. The application connects to a Microsoft SQL Server 2005 database.

You need to separate the security-related exceptions from the other exceptions for database operations at run time.

Which code segment should you use?

A. Catch ex As System.Security.SecurityException

```
'Handle all database security related exceptions.
```

```
End Try
```

B. Catch ex As System.Data.SqlClient.SqlException

```
For i As Integer = 0 To ex.Errors.Count - 1
```

```
If ex.Errors(i).[Class].ToString() = "14" Then
```

```
'Handle all database security related exceptions.
```

```
Else
```

```
'Handle other exceptions
```

```
End If
```

```
Next
```

```
End Try
```

C. Catch ex As System.Data.SqlClient.SqlException

```
For i As Integer = 0 To ex.Errors.Count - 1
```

```
If ex.Errors(i).Number = 14 Then
    'Handle all database security related exceptions.
Else
    'Handle other exceptions
End If
```

```
Next
```

```
End Try
```

```
D. Catch ex As System.Data.SqlClient.SqlException
```

```
For i As Integer = 0 To ex.Errors.Count - 1
```

```
If ex.Errors(i).Message.Contains("Security") Then
```

```
    'Handle all database security related exceptions.
```

```
Else
```

```
    'Handle other exceptions
```

```
End If
```

```
Next
```

```
End Try
```

**Answer: B**

4. You create an application by using the Microsoft .NET Framework 3.5 and Microsoft ADO.NET. The application connects to a Microsoft SQL Server 2005 database.

You write the following code segment.

```
Dim queryString As String = "Select Name, Age from dbo.Table_1"
```

```
Dim command As New _
```

```
    SqlCommand(queryString, DirectCast(connection, SqlConnection))
```

You need to get the value that is contained in the first column of the first row of the result set returned by the query.

Which code segment should you use?

A. Dim value As Object = command.ExecuteScalar()

```
Dim requiredValue As String = value.ToString()
```

B. Dim value As Integer = command.ExecuteNonQuery()

```
Dim requiredValue As String = value.ToString()
```

C. Dim value As SqlDataReader = \_

```
command.ExecuteReader(CommandBehavior.SingleRow)
```

```
Dim requiredValue As String = value(0).ToString()
```

D. Dim value As SqlDataReader = \_

```
command.ExecuteReader(CommandBehavior.SingleRow)
```

```
Dim requiredValue As String = value(1).ToString()
```

**Answer:** A

5. You create an application by using the Microsoft .NET Framework 3.5 and Microsoft ADO.NET. The application connects to a Microsoft SQL Server 2005 database.

You write the following code segment. (Line numbers are included for reference only.)

```
01 Using connection As New SqlConnection(connectionString)
```

```
02 Dim cmd As New SqlCommand(queryString, connection)
```

```
03 connection.Open()
```

```
04
```

```
05 While sdrdr.Read()
```

```
06     ' use the data in the reader
```

```
07 End While
```

```
08 End Using
```

You need to ensure that the memory is used efficiently when retrieving BLOBs from the database.

Which code segment should you insert at line 04?

A. Dim sdrdr As SqlDataReader = \_

```
cmd.ExecuteReader()
```

B. Dim sdrdr As SqlDataReader = \_

```
cmd.ExecuteReader(CommandBehavior.[Default])
```

C. Dim sdrdr As SqlDataReader = \_

```
cmd.ExecuteReader(CommandBehavior.SchemaOnly)
```

D. Dim sdrdr As SqlDataReader = \_

```
cmd.ExecuteReader(CommandBehavior.SequentialAccess)
```

**Answer: D**

6. You create an application by using the Microsoft .NET Framework 3.5 and Microsoft ADO.NET. The application connects to a Microsoft SQL Server 2005 database.

You write the following code segment.

```
Dim query As String = _  
    "Select EmpNo, EmpName from dbo.Table_1; " + _  
    "select Name, Age from dbo.Table_2"  
Dim command As New SqlCommand(query, connection)  
Dim reader As SqlDataReader = command.ExecuteReader()
```

You need to ensure that the application reads all the rows returned by the code segment.

Which code segment should you use?

A. While reader.NextResult()

```
    Console.WriteLine([String].Format("{0}, {1}", reader(0), reader(1)))  
    reader.Read()
```

End While

B. While reader.Read()

```
    Console.WriteLine([String].Format("{0}, {1}", reader(0), reader(1)))  
    reader.NextResult()
```

End While

C. While reader.Read()

```
    Console.WriteLine([String].Format("{0}, {1}", reader(0), reader(1)))
```

End While

```
reader.NextResult()
```

```
While reader.Read()
```

```
    Console.WriteLine([String].Format("{0}, {1}", reader(0), reader(1)))
```

End While

D. While reader.NextResult()

```
    Console.WriteLine([String].Format("{0}, {1}", reader(0), reader(1)))
```

End While

```
reader.Read()  
While reader.NextResult()  
    Console.WriteLine([String].Format("{0}, {1}", reader(0), reader(1)))  
End While
```

**Answer: C**

7. You create an application by using the Microsoft .NET Framework 3.5 and Microsoft ADO.NET.

The application has a DataTable object named OrderDetailTable. The object has the following columns:

ID  
OrderID  
ProductID  
Quantity  
LineTotal

The OrderDetailTable object is populated with data provided by a business partner. Some of the records contain a null value in the LineTotal field and 0 in the Quantity field.

You write the following code segment. (Line numbers are included for reference only.)

```
01 Dim col As New DataColumn("UnitPrice", GetType(Decimal))
```

```
02
```

```
03 OrderDetailTable.Columns.Add(col)
```

You need to add a DataColumn named UnitPrice to the OrderDetailTable object.

Which line of code should you insert at line 02?

- A. col.Expression = "LineTotal/Quantity"
- B. col.Expression = "LineTotal/ISNULL(Quantity, 1)"
- C. col.Expression = "LineTotal.Value/ISNULL(Quantity.Value, 1)"
- D. col.Expression = "iif(Quantity > 0, LineTotal/Quantity, 0)"

**Answer: D**

8. You create an application by using the Microsoft .NET Framework 3.5 and Microsoft ADO.NET.

The application contains a DataSet object named orderDS. The object contains a table named Order as shown in the following exhibit.

The application uses a SqlDataAdapter object named daOrder to populate the Order table.

You write the following code segment. (Line numbers are included for reference only.)

```
01 Private Sub FillOrderTable(ByVal pageIndex As Integer)
```

```
02   Dim pageSize As Integer = 5
```

```
03
```

```
04 End Sub
```

You need to fill the Order table with the next set of 5 records for each increase in the pageIndex value.

Which code segment should you insert at line 03?

A. Dim sql As String = "SELECT SalesOrderID, CustomerID, " + \_

```
"OrderDate FROM Sales.SalesOrderHeader"
```

```
daOrder.SelectCommand.CommandText = sql
```

```
daOrder.Fill(orderDS, pageIndex, pageSize, "Order")
```

B. Dim startRecord As Integer = (pageIndex - 1) \* pageSize

```
Dim sql As String = "SELECT SalesOrderID, CustomerID, " + _
```

```
"OrderDate FROM Sales.SalesOrderHeader"
```

```
daOrder.SelectCommand.CommandText = sql
```

```
daOrder.Fill(orderDS, startRecord, pageSize, "Order")
```

C. Dim sql As String = \_

```
String.Format("SELECT TOP {0} SalesOrderID, " + _
```

```
"CustomerID, OrderDate FROM Sales.SalesOrderHeader " + _
```

```
"WHERE SalesOrderID > {1}", pageSize, pageIndex)
```

```
daOrder.SelectCommand.CommandText = sql
```

```
daOrder.Fill(orderDS, "Order")
```

D. Dim startRecord As Integer = (pageIndex - 1) \* pageSize

```
Dim sql As String = _
```

```
String.Format("SELECT TOP {0} SalesOrderID, " + _
```

```
"CustomerID, OrderDate FROM Sales.SalesOrderHeader " + _
```

```
"WHERE SalesOrderID > {1}", pageSize, startRecord)
```

```
daOrder.SelectCommand.CommandText = sql
```

```
daOrder.Fill(orderDS, "Order")
```

**Answer: B**

9. You create an application by using the Microsoft .NET Framework 3.5 and Microsoft ADO.NET.

The application contains a TextBox control named txtProductID. The application will return a list of active products that have the ProductID field equal to the txtProductID.Text property.

You write the following code segment. (Line numbers are included for reference only.)

```
01 Private Function GetProducts(ByVal cn _
```

```
    As SqlConnection) As DataSet
```

```
02 Dim cmd As New SqlCommand()
```

```
03 cmd.Connection = cn
```

```
04 Dim da As New SqlDataAdapter(cmd)
```

```
05 Dim ds As New DataSet()
```

```
06
```

```
07 da.Fill(ds)
```

```
08 Return ds
```

```
09 End Function
```

You need to populate the DataSet object with product records while avoiding possible SQL injection attacks.

Which code segment should you insert at line 06?

A. cmd.CommandText = \_

```
String.Format("sp_sqlexec 'SELECT ProductID, " + _
```

```
"Name FROM Product WHERE ProductID={0} AND IsActive=1", _
```

```
txtProductID.Text)
```

B. cmd.CommandText = \_

```
String.Format("SELECT ProductID, " + _
```

```
"Name FROM Product WHERE ProductID={0} AND IsActive=1", _
```

```
txtProductID.Text)
cmd.Prepare()
C. cmd.CommandText = _
String.Format("SELECT ProductID, " + _
"Name FROM Product WHERE ProductID={0} AND IsActive=1", _
txtProductID.Text)
cmd.CommandType = CommandType.TableDirect
D. cmd.CommandText = "SELECT ProductID, " + _
"Name FROM Product WHERE ProductID=@productID AND IsActive=1"
cmd.Parameters.AddWithValue("@productID", txtProductID.Text)
```

**Answer: D**

10. You create an application by using the Microsoft .NET Framework 3.5 and Microsoft ADO.NET. The application connects to a Microsoft SQL Server 2005 database.

The application analyzes large amounts of transaction data that are stored in a different database.

You write the following code segment. (Line numbers are included for reference only.)

```
01 Using connection As New SqlConnection(sourceConnectionString)
02     Using connection2 As _
           New SqlConnection(destinationConnectionString)
03         Using command As New SqlCommand()
04             connection.Open()
05             connection2.Open()
06             Using reader As SqlDataReader = command.ExecuteReader()
07                 Using bulkCopy As New SqlBulkCopy(connection2)
08
09                 End Using
10             End Using
11         End Using
12     End Using
13 End Using
```

You need to copy the transaction data to the database of the application.

Which code segment should you insert at line 08?

A. `reader.Read()`

`bulkCopy.WriteToServer(reader)`

B. `bulkCopy.DestinationTableName = "Transactions"`

`bulkCopy.WriteToServer(reader)`

C. `bulkCopy.DestinationTableName = "Transactions"`

`AddHandler bulkCopy.SqlRowsCopied, _`

`AddressOf bulkCopy_SqlRowsCopied`

D. `While reader.Read()`

`bulkCopy.WriteToServer(reader)`

`End While`

**Answer: B**
