Title : Juniper Mist AI, Professional (JNCIP-MistAI)

Version : DEMO

1.A Network Architect is automating the full lifecycle of a temporary event site. The Day 1 script creates the site, claims devices, assigns them, and applies templates. A corresponding Day 2 "cleanup" script must completely remove the site.
What is the correct order of operations for the cleanup script?
A. 1. Delete Site -> 2. Unclaim Devices
B. 1. Delete Site -> 2. Unassign Devices
C. 1. Unclaim Devices -> 2. Unassign Devices -> 3. Delete Site
D. 1. Unassign all devices from the site -> 2. Delete the site -> 3. Unclaim devices (optional)
Answer: D

2.A Network Architect is evaluating the automation tools available for managing their Juniper Mist environment. They need a tool that allows them to define their entire site configuration declaratively as code, store it in a Git repository, and manage its lifecycle.
Which tool is specifically designed for this "Infrastructure as Code" approach to managing Mist?
A. Terraform with the Juniper Mist Provider.
B. Postman
C. `mist-cli`
D. A custom Python script using the `requests` library.
Answer: A

3.An IoT Specialist is writing a script to create a new WLAN specifically for their IoT devices. They are constructing the body of the `POST` request to the `/api/v1/sites/{site_id}/wlans` endpoint.
Which of the following headers must be included in the request to inform the Mist API that the request body contains JSON data?
A. `Content-Type: application/json`
B. `Data-Type: json`
C. `X-Request-Format: json`
D. `Accept: application/json`
Answer: A

4.A developer is troubleshooting a failed API call to the Mist platform. The script attempts to update a site's name with a `PUT` request, but it receives a `404 Not Found` HTTP status code. The developer has confirmed their API token is valid and has the correct permissions.
Review the details of the failed call:
HTTP Method: PUT
URL: https://api.mist.com/api/v1/sites/a1b2c3d4-e5f6-7890-1234-ffffffffffff
Headers:
Authorization: Token ...
Content-Type: application/json
Body:
{"name": "New-Site-Name"}
What are the most likely reasons for the `404 Not Found` error? (Choose 2.)
A. The `site_id` specified in the URL does not exist in the organization.
B. The HTTP Method should have been `POST`.

C. The API token does not have privileges to modify sites.
D. The API call was made to the wrong Mist cloud (e.g., the Global 02 cloud instead of Global 01).
E. The JSON in the request body is malformed.
Answer: A, D

5.A Network Administrator is analyzing the "Client Density" insight for a specific floorplan. The dashboard shows a heatmap with several areas colored red, indicating high client counts.
What is the primary data source used to generate this client density heatmap?
A. Data from the wired switches, showing the number of clients per port.
B. The number of successful authentications processed by the RADIUS server.
C. A log of all DHCP requests received from clients on the floor.
D. Real-time location data of wireless clients, calculated by the Mist Location Engine using Wi-Fi and vBLE information.
Answer: D
