## Exam : DP-200

# Title:Implementing an Azure DataSolution

# Version : DEMO

### 1. Topic 1, Proseware Inc

### Background

Proseware, Inc, develops and manages a product named Poll Taker. The product is used for delivering public opinion polling and analysis.

Polling data comes from a variety of sources, including online surveys, house-to-house interviews, and booths at public events.

### Polling data

Polling data is stored in one of the two locations:

- An on-premises Microsoft SQL Server 2019 database named PollingData
- Azure Data Lake Gen 2

Data in Data Lake is queried by using PolyBase

### Poll metadata

Each poll has associated metadata with information about the poll including the date and number of respondents. The data is stored as JSON.

### Phone-based polling

### Security

- Phone-based poll data must only be uploaded by authorized users from authorized devices
- Contractors must not have access to any polling data other than their own
- Access to polling data must set on a per-active directory user basis

### Data migration and loading

- All data migration processes must use Azure Data Factory
- All data migrations must run automatically during non-business hours
- Data migrations must be reliable and retry when needed

### Performance

After six months, raw polling data should be moved to a storage account. The storage must be available in the event of a regional disaster. The solution must minimize costs.

### Deployments

- All deployments must be performed by using Azure DevOps. Deployments must use templates used in multiple environments

- No credentials or secrets should be used during deployments

### Reliability

All services and processes must be resilient to a regional Azure outage.

### Monitoring

All Azure services must be monitored by using Azure Monitor. On-premises SQL Server performance must be monitored.

You need to ensure that phone-based poling data can be analyzed in the PollingData database. How should you configure Azure Data Factory?

- A. Use a tumbling schedule trigger
- B. Use an event-based trigger
- C. Use a schedule trigger
- D. Use manual execution

### Answer: C

### Explanation:

When creating a schedule trigger, you specify a schedule (start date, recurrence, end date etc.) for the trigger, and associate with a Data Factory pipeline.

Scenario:

All data migration processes must use Azure Data Factory

All data migrations must run automatically during non-business hours

References: https://docs.microsoft.com/en-us/azure/data-factory/how-to-create-schedule-trigger

### 2.DRAG DROP

You need to provision the polling data storage account.

How should you configure the storage account? To answer, drag the appropriate Configuration Value to the correct Setting. Each Configuration Value may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content. NOTE: Each correct selection is worth one point.

### Configuration values Answer Area

LRS	Setting Configuration value
GRS	Account type
RA-GRS	Deplication type
Storage	Replication type
StorageV2	
Answer:	

# LRSSettingConfiguration valueGRSAccount typeStorageV2RA-GRSReplication typeRA-GRSStorageStorageV2

### Configuration values Answer Area

### **Explanation:**

Account type: StorageV2

You must create new storage accounts as type StorageV2 (general-purpose V2) to take advantage of Data Lake Storage Gen2 features.

Scenario: Polling data is stored in one of the two locations:

∞ An on-premises Microsoft SQL Server 2019 database named PollingData

⇔ Azure Data Lake Gen 2

Data in Data Lake is queried by using PolyBase

Replication type: RA-GRS

Scenario: All services and processes must be resilient to a regional Azure outage.

Geo-redundant storage (GRS) is designed to provide at least 99.99999999999999999% (16 9's) durability of objects over a given year by replicating your data to a secondary region that is hundreds of miles away from the primary region. If your storage account has GRS enabled, then your data is durable even in the case of a complete regional outage or a disaster in which the primary region isn't recoverable. If you opt for GRS, you have two related options to choose from:

□ GRS replicates your data to another data center in a secondary region, but that data is available to be read only if Microsoft initiates a failover from the primary to secondary region.

Sead-access geo-redundant storage (RA-GRS) is based on GRS. RA-GRS replicates your data to another data center in a secondary region, and also provides you with the option to read from the secondary region. With RA-GRS, you can read from the secondary region regardless of whether Microsoft initiates a failover from the primary to secondary region.

### 3.HOTSPOT

You need to ensure that Azure Data Factory pipelines can be deployed.

How should you configure authentication and authorization for deployments? To answer, select the appropriate options in the answer choices. NOTE: Each correct selection is worth one point.

Security requirement	Technology
Authorization	RBAC DAC MAC Claims∨✓✓Service Principal
	Kerberos Certificate-based Bearer Token
Answer:	
Security requirement	Technology
Authorization	RBAC V
Authoritoption	DAC MAC Claims
Authentication	MAC

### **Explanation:**

The way you control access to resources using RBAC is to create role assignments. This is a key concept to understand - it's how permissions are enforced. A role assignment consists of three elements: security principal, role definition, and scope.

Scenario:

No credentials or secrets should be used during deployments

Phone-based poll data must only be uploaded by authorized users from authorized devices

Contractors must not have access to any polling data other than their own

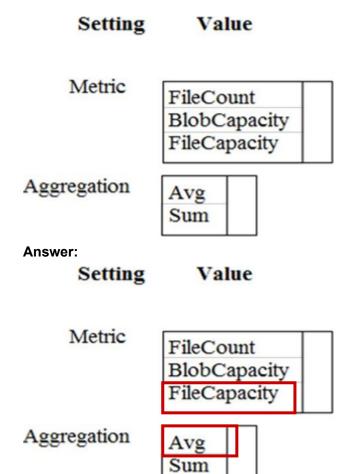

Access to polling data must set on a per-active directory user basis

References: https://docs.microsoft.com/en-us/azure/role-based-access-control/overview

### 4.HOTSPOT

You need to ensure phone-based polling data upload reliability requirements are met.

How should you configure monitoring? To answer, select the appropriate options in the answer area. NOTE: Each correct selection is worth one point.

### Explanation:

Box 1: FileCapacity

FileCapacity is the amount of storage used by the storage account's File service in bytes.

Box 2: Avg

The aggregation type of the FileCapacity metric is Avg.

Scenario:

All services and processes must be resilient to a regional Azure outage.

All Azure services must be monitored by using Azure Monitor. On-premises SQL Server performance must be monitored.

References: https://docs.microsoft.com/en-us/azure/azure-monitor/platform/metrics-supported

### 5.HOTSPOT

You need to ensure polling data security requirements are met.

Which security technologies should you use? To answer, select the appropriate options in the answer area. NOTE: Each correct selection is worth one point.

SQL Server	Azure Active Directory user	V
	Domain Active Directory user	1
	Managed Identity	
PolyBase	Database scoped credential	V
	Database encryption key	- 69
	Application role	
_		
Answer: Context	Security technology	
Context		
Context	Azure Active Directory user	V
Context		
Context	Azure Active Directory user Domain Active Directory user Managed Identity	
Context SQL Server	Azure Active Directory user Domain Active Directory user	

### Context Security technology

### Explanation:

Box 1: Azure Active Directory user

Scenario:

Access to polling data must set on a per-active directory user basis

Box 2: DataBase Scoped Credential

SQL Server uses a database scoped credential to access non-public Azure blob storage or

Kerberos-secured Hadoop clusters with PolyBase.

PolyBase cannot authenticate by using Azure AD authentication.

References:

https://docs.microsoft.com/en-us/sql/t-sql/statements/create-database-scoped-credential-transact-sql
